

Stanolone Dht Bodybuilding Supplement Anabolic White Crystalline Powder Cas 521-18-6

Our Product Introduction

for more products please visit us on bodybuild-supplement.com

Basic Information

- Place of Origin: China
- Minimum Order Quantity: 10Grams
- Price: USD
- Packaging Details: 1kg/Foil Bag
- Delivery Time: 3-7days after received payment
- Payment Terms: T/T, Western Union, PayPal
- Supply Ability: 5000KG Per Year

Product Specification

- Product Name: Stanolone
- Appearance: White Crystalline Powder
- Purity: 99%
- Cas: 521-18-6
- Usage: Bodybuilding
- Highlight: **Stanolone Dht Bodybuilding Supplement,
Anabolic Bodybuilding Supplement,
Cas 521-18-6**

Product Description

Purity 99% Stanolone Dht Bodybuilding Anabolic White Crystalline Powder Cas 521-18-6

Description:

Androsanolone is formed primarily in the testes, hair follicles, adrenal glands, and prostate gland when interacts with an enzyme in the body. In utero, androsanolone stimulates the development of masculine characteristics in male embryos and fetuses. During puberty, it is involved in the development of other male characteristics, such as body and facial hair and a deep voice. Later in life, levels of DHT are often much lower, and its presence can cause problems.

Andronanolone is identical to the body's own dihydro, which we know is formed by the peripheral conversion. Therefore, some people call androstenedione a synthetic. Androstenedione has a predominantly effect and, due to its structure, cannot be converted. For quick gains in strength and muscle mass, androsanolone is of little value.

Androstenedione was once a favorite competition for athletes because it helps in gaining harder muscle by increasing levels without aromatizing to lower fat content. Many athletes use androsanolone in training for doping testing championships because the substance only stays in the body for a short time and epitestosterone values are not affected. Another positive feature is the absence of hepatotoxicity in the injectable form. Today, however, androstenedione is rarely used by athletes. One reason for this is that almost all European and American compounds are no longer commercially available. Another reason is that most athletes use the still readily available Masteron, which has a similar effect. Both genuine and fake Androstenedione are not available on the black market.

Application

The main functions of androstenedione are:

1. Maintain spermatogenesis;
2. Stimulate the development of reproductive organs, promote the appearance of male secondary symptoms and maintain their normal shape;
3. Promote protein synthesis, especially protein synthesis in muscles and reproductive organs, and at the same time promote bone growth, calcium and phosphorus deposition, and red blood cell production.

COA:

Description	White Or Practically White Crystalline Powder	
Ref. Standard	Enterprise Standard	
Results Of Analysis Tests		
Tests	Analysis Standard	Results
Melting Point	176~181°C	176.5~181°C
Specific Rotation	+25°~ +31°	+25.9°
Loss On Drying	≤0.5%	0.36%
Assay	≥97%	98.1%
Conclusion	Be Conform With Enterprise Standard
